

Over the next several weeks, your sonnen system will be receiving an update to our latest version, 1.6.0. As a part of this release, we will be introducing a new display version in addition to many other improvements and bug fixes. For systems with a built-in screen, below is an overview of features as well as instructions on how to calibrate the display if it does not initially respond to touch.

New display features

- Energy flow can be seen in the new live screen
- Dynamic display of the energy status as well as the state of charge on the main screen
- Ability to set your backup power buffer from the display
- New display settings such as screen brightness, language, and time format
- Device information

Calibrating your display

It may be necessary to recalibrate your display if it does not respond correctly to touch. The display can be easily recalibrated by going through the following steps:

1. Press and hold the display for 5-10 seconds until a prompt with a countdown appears with the instructions to continue holding.
2. After the countdown has finished, a new screen will appear with instruction to release the display.
3. Calibration has now started.
4. Five crosshairs will appear one after the other (one in each of the corners and in the center of the screen).
5. Press each crosshair as it appears.
6. Your display has been recalibrated.
7. If the first calibration was not successful, please perform it again.
8. If the calibration is not successful after multiple attempts, reach out to the technical service team for further assistance.
